

Case Study

How We've Helped - Chart Review

PHASE II HEART FAILURE - US

Challenge

The sponsor knew that their protocol design and I/E criteria **would result in less than 0.25% of patient candidate charts being eligible for enrollment**. As such, they needed a system, process and expertise to identify every potential chart and patient for their extremely challenging Class III heart failure study.

Solution

ThreeWire launched our **Chart Review™ service** at each of the three participating sites, using highly skilled cardiac electrophysiology nurses with extensive experience in similar studies. It was essential that these nurses could expertly evaluate chart data in light of the continual dynamic changes in heart failure metrics for Class III patients.

Results

Within three weeks, **we reviewed 1,311 charts, identified 80 potential study candidates, and contributed 2 enrollments**.
