

Case Study

WCG ThreeWire – Enrollment Assistants™, Data Entry

Oncology Study

WCG ThreeWire has solved some of the greatest enrollment challenges with the hardest-to-reach patient populations on behalf of our customers. This case study will help summarize the results and predictable success you can expect when we apply a unique, deliberate approach to finding the patients you need.

Challenge

While enrollment was going well with this solid tumor oncology study, the amount of data entry associated with the study was significant, and the sites quickly fell behind on data entry requirements. Our client needed to get the data entry backlog filled, and done so within a **short time window** in order to present the data at an upcoming conference. Not only did sites lack the time and resources to keep up with data entry, their focus was being taken off the important task of enrolling new patients.

Solution

Understanding the need for qualified, clinically-trained professionals to ensure our client's data entry and site support objectives were met, WCG ThreeWire initiated **Enrollment Assistant™** site support as the **ideal solution to supplement on-site resource gaps** for the study. WCG ThreeWire placed on-site Enrollment Assistants who were local to communities around sites, and had previous oncology experience. Then WCG ThreeWire trained the Enrollment Assistants based on the study's specific requirements as well as any unique site requirements. Initially, we placed an Enrollment Assistant at one site with great success. Based on the results, our client **expanded the effort to additional sites** to help complete data entry in the EDC (Electronic Data Capture) system used for the program.

Results

In just over **six months**, WCG ThreeWire's Enrollment Assistants were able to help each site **catch up on the backlog of data**, and stay on track with data entry, allowing sites to focus their energies on enrolling patients.
