

WCG Support Lifts Study Enrollment by 56%

CHALLENGE

A sponsor had a complex adult Staphylococcus vaccine with an enrollment criteria requiring surgical schedule review to determine patient eligibility.

SOLUTION

WCG developed a recruitment strategy that extended the site's reach by developing and managing internal and external referral provider networks. These networks identified potential participants outside the study site and brought those individuals to the study site through the managed referral pathway. These referral networks also developed an augmented daily chart review of networked surgical schedules to identify eligible participants.

RESULTS

WCG accelerated enrollment at supported sites by 56% allowing the study to meet its enrollment goal 12 months early.
